(54) Single-carbon bridged bis cyclopentadienyl compounds and metallocene complexes thereof

(57) The present invention relates to metallocenes, wherein the two cyclopentadienyl rings are connected to each other by a single carbon atom characterized by the following general formula III

where each A, equal to or different from each other, is selected from the group consisting of: hydrogen, OR³, NRR⁴, or SR⁵; and to compounds of formula IV

wherein each B, equal to or different from each other, is selected from the group consisting of: OH, NRH or SH, obtained by hydrolizing the corresponding oxygen, nitrogen or sulfur containing groups from compounds of formula III. These compounds are used as active catalyst components in the polymerization of olefins.

EP 1 095 944 A1

Description

[0001] The present invention relates to a new process for synthesizing single carbon bridge bis cyclopentadienyl compounds and metal complexes obtained therefrom. And to the use of these complexes for polymerization and co-

polymerization of olefins.
 [0002] The metallocene compounds field has experienced a big development since the first syntheses of these compounds in the fifties (G. Wilkinson et al., *J. Am. Chem. Soc.*, (1953), 75, 1011). This development is basically due to the large increase in the number of applications wherein these compounds are used. So, they can be used as catalysts of hydrogenation, epoxidation, double bond isomerization, ketones reduction, aldolic reaction, synthesis of different substituted olefins, etc., but their largest use is as catalyst components for olefin polymerization, as they can be activated for this use by alumoxanes or other non-coordinative anion precursors (for example boron compounds). In this field metallocenes of group 4 (Ti, Zr, Hf) in particular have been developed, but also metallocenes of groups 3, 5 and 6. Metallocenes have been prepared for working in very different conditions (solution, suspension, mass, gas phase, high pressure and temperature processes, etc.). They have been used for polymerizing and copolymerizing simple 1-olefins, basically ethylene and propylene, but also more complex olefins (cycloolefins, diolefins and also olefins with polar groups (see for example W. A. Nugent et al., *J. Am. Chem. Soc.* (1989), 111, 6435; R.M. Waymouth et al., *J. Am. Chem. Soc.* (1992), 114, 9679; H. Yasuda et al., *Macromol. Chem. Phys.* (1995), 196, 2417).

[0003] For adapting to the different needs of each application, very different metallocenes were synthesized, basically differing by the different substitutions on the cyclopentadienyl rings of the complex, as it is possible to influence in this way, both sterically and electronically, the reactivity of the active center. A specially relevant development was the introduction of at least one bridge connecting the two cyclopentadienyl rings (H. H. Britzinger et al., *J. Organomet. Chem.*, (1979), 173, 6270), since it determines the reactivity of the metallocene conditioning its steric nature in two ways: (1) influencing the monomer greater or smaller accessibility to the active center as the bridge largely determines the angle spread between the cyclopentadienyl rings and (2) preventing the free rotation of the rings and, therefore, determining the symmetry of the whole molecule. On the other hand the bridge can also influence the electronic nature of the metallocene. In this way it has been obtained a better stability of certain metallocenes, a greater or smaller discrimination of the monomers that are incorporated into the polymer because of their size and the possibility of obtaining stereoregular 1-olefin polymers (isotactic, syndiotactic, hemiisotactic).

[0004] It is known that in order to obtain specific polymer structures, the use of a single-carbon bridge is preferred (e. g. EP A 351 392). A common process for obtaining this type of bridged ligands comprises reacting a ketone with a cyclopentadienyl in the presence of a strong base, then the obtained fulvene is reacted with another cyclopentadienyl compound again in the presence of a base. Generally these procedure requires a purification of the fulvene or optionally the use of a commercially available one.

[0005] Particularly for industrial uses, a one-step process is preferred to a two-step process. A one-step process is developed, for example, in EP 751 143, wherein one or two cyclopentadienyl compounds, at least one being a substituted cyclopentadienyl, are reacted with a carbonyl compound in the presence of a base and a phase transfer catalyst; the preferred bases are hydroxides of elements belonging to groups 1, 2 or 13 of the periodic table; in the examples sodium hydroxide is used. Another one-step process is described in EP 722 949. It relates to a process for preparing bis-cyclopentadienyl compounds bridged by a single carbon atom. The compound is prepared by reacting a carbonyl compound with a cyclopentadienyl compound in the presence of a base and of an oxygen-containing solvent having an atomic ratio carbon/oxygen not higher than 3.

[0006] These one-step processes make use of strong bases such as sodium or potassium hydroxide; therefore they are not adequate for synthesizing bridged bis cyclopentadienyl compounds wherein the bridge is functionalized with hydrolyzable groups. On the other hand, bridged bis cyclopentadienyl compounds having these groups, such as for example trialkyl silyloxy group, bonded to the bridge can be useful to obtain complexes that can be, for example, easily supported on a heterogeneous carrier (see for example EP 839 836). Therefore it could be desirable a new process that permits an easy and one-step synthesis of this kind of compounds.

[0007] An object of the present invention is a new process for synthesizing single-carbon bridged bis cyclopentadienyl compounds wherein the bridge contains a hydrolyzable group.

[0008] A further object of the present invention is a new class of single-carbon bridged bis cyclopentadienyl compounds substituted on the bridge with a hydrolyzable group, and the metallocene obtained by the use of these ligands.

[0009] Another further object of the present invention is a new class of single carbon bridged metallocenes obtained by hydrolysis of the functional group on the bridge.

[0010] Another still further object of the present invention is the use of the previously described metallocenes for polymerization and copolymerization of olefins.

[0011] The present invention relates to bis cyclopentadienyl compounds, wherein the two cyclopentadienyl rings are connected to each other by a single carbon atom characterized by the following general formula I

10

15

35

40

45

[0017] The process is realized in a temperature range between -100 and 150°C, preferably between -78 and 90°C, or at the reflux temperature of the used solvents system, it is also possible to vary the temperature during the process. Any kind of solvent compatible with the reactants is used, preferably an aliphatic hydrocarbon, an aromatic hydrocarbon, or an ether, for instance: hexane, toluene, tetrahydrofuran (THF) or ethyl ether. The process is preferably carried out under inert atmosphere of, for example nitrogen or argon, and with anhydrous solvents. The skilled man can select the appropriate reaction conditions on the basis of his knowledge and the reactants used.

[0018] In a particular embodiment wherein two L groups are different, the single carbon bridged bis cyclopentadienyl compound, object of the present invention, is obtained by a one-pot process comprising: contacting a compound (LH) selected from the group consisting of:

EP 1 095 944 A1

with a metallating compound selected from the group consisting of:

organolithium compounds, organosodium compounds, organopotassium compounds, organomagnesium, sodium hydride, potassium hydride, lithium, sodium, or potassium; preferably lithium alkyl, sodium alkyl, potassium alkyl; more preferably butyllithium;

with a compound of general formula II

adding a second compound LH different from the first one;
adding a second amount of metallating compound as above defined;
increasing the temperature and recovering the product.

[0019] Preferably the compound LH is contacted with the compound of formula II in the presence of a metallating compound, then a second compound LH and the metallating compound are mixed; the mixture is then introduced to the reaction mixture.

[0020] Preferably for one mole of compound of formula II one mole of the first LH compound, one mole of the second one and two moles of a metallating compounds are used. More preferably an equimolar mixture of LH and metallating agent is put in contact with a compound of formula II, then an equimolar mixture of an LH compound different from the first one and a metallating agent is added to the reaction product.

[0021] The skilled man can select on the basis of his knowledge the appropriate temperatures of the first and the second phase that depends from the cyclopentadienyl compounds used. Usually the first phase is performed at a temperature range from -78°C to room temperature and the second phase at a temperature range from -78°C to the boiling point of the solvent.

[0022] The single-carbon bridged cyclopentadienyl compounds object of the present invention are used for synthesizing metallocene complexes of general formula III

Wherein :

Each L' is independently a cyclopentadienyl compound and forms with the metal a η^5 complex, it is selected from the group consisting of:

M is a transition metal of groups 3-6 of the periodic table; preferably it is selected from the group consisting of zirconium, titanium or hafnium;

m is a number coinciding with the oxidation state of the transition metal;

Each X, equal to or different from each other, is selected from the group comprising: halogen, hydrogen, OR, N (R)₂, C₁-C₂₀ alkyl or C₆-C₂₀ aryl; preferably it is halogen.

[0023] Examples of metallocenes of formula III are:

- (1-trimethylsiloxy-4,4-bis(cyclopentadienyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-4,4-bis(indenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-4,4-bis(fluorenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-4,4-bis(tetrahydroindenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-4,4-bis(octahydrofluorenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-4,4-bis(cyclopentadienyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-4,4-bis(indenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-4,4-bis(fluorenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-4,4-bis(tetrahydroindenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-4,4-bis(octahydrofluorenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-4-cyclopentadienyl-4-indenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-4-cyclopentadienyl-4-fluorenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-4-cyclopentadienyl-4-tetrahydroindenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-4-cyclopentadienyl-4-octahydrofluorenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-3,3-bis(cyclopentadienyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-3,3-bis(indenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-3,3-bis(fluorenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-3,3-bis(tetrahydroindenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-3,3-bis(octahydrofluorenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-3,3-bis(cyclopentadienyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-3,3-bis(indenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-3,3-bis(fluorenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-3,3-bis(tetrahydroindenyl)pentane)zirconium dichloride;
- (1,5-bis-trimethylsiloxy-3,3-bis(octahydrofluorenyl)pentane)zirconium dichloride;
- (1-trimethylsiloxy-3-cyclopentadienyl-3-indenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-3-cyclopentadienyl-3-fluorenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-3-cyclopentadienyl-3-tetrahydroindenyl-pentane)zirconium dichloride;
- (1-trimethylsiloxy-3-cyclopentadienyl-3-octahydrofluorenyl-pentane)zirconium dichloride;
- (1-triethylsiloxy-4,4-bis(cyclopentadienyl)pentane)zirconium dichloride;

[0024] The metallocene complexes of general formula III are synthesized according to a process comprising the following steps:

- 5

[0025] With compounds of formula III it is possible to synthesize compounds of general formula IV:

20

- 25

- 50

55

rate, etc.).

[0028] The catalyst component of the present invention, i.e. the metallocene complex of formula III or IV (preferably when at least a hydrolizable group A in formula III is OSiR_3 or when in formula IV at least one B is OH), is especially fit for being supported on a proper inorganic support as described in EP 839 836. As supporting material, any type of inorganic oxides are used, for example inorganic oxides such as: silica, alumina, silica alumina, aluminum phosphates and mixtures thereof, obtaining supported catalysts with contents in transition metals between 0.01 and 4% by weight, preferably between 0.1 and 1%. A particularly preferred support is silica calcined at a temperature between 600°C and 800°C and also MAO modified silica..

[0029] A process that is fit for preparing supported catalysts according to this invention comprises the following steps:

a) reacting, under anhydrous conditions and inert atmosphere, a solution of at least one metallocene complex of formula III or IV, with a suspension of the supporting material at a temperature between -20° C and 90 °C. The solvent used for this procedure is an aliphatic or aromatic hydrocarbon.

b) filtration and washing with a aliphatic or aromatic hydrocarbon.

[0030] Another process that can properly be used comprises the following steps:

a) reacting at least one metallocene complex of formula III or IV with the supporting material by using a solution of the compound to heterogenize;

b) eliminating the solvent through evaporation;

c) warming the solid residue up to a temperature between 25 and 150° C.

[0031] Besides, the resulting residue obtained by this process, is optionally subjected to washing and subsequent filtration.

[0032] The amount of metallocene of formula III or formula IV which is anchored in these conditions directly depends on the concentration of the reactive groups present in the support. For this reason silica, for example, should preferably have been calcinated at a temperature between 600° C and 800° C.

[0033] A solid catalyst system is obtained by adding to the solid catalyst component a cocatalyst, for example alumoxane, boron compounds or mixtures thereof, at any step of the processes described above. In a particularly advantageous process the cocatalyst, preferably alumoxane, is added to the support, preferably silica, and then the treated support is reacted with the metallocene of formula III or IV according to the process described in patent 98500101.5.

[0034] For the polymerization in solution, the cocatalyst is partly premixed with a solution of a metallocene complex according to formula III or IV and is partly added directly to the reaction medium; alternatively, the catalyst is directly added to the polymerization medium, which contains the cocatalyst.

[0035] For the polymerization in suspension, the cocatalyst either is previously mixed with the supported solid catalyst or it is added to the polymerization medium before the supported catalyst, or both operations are sequentially realized.

[0036] The most proper polymerization procedure changes according to the chosen type of polymerization process (solution, suspension, slurry or gas phase).

[0037] The process consists in putting in contact the monomer, or, in certain cases, the monomer and the comonomer, with a catalytic composition according to the present invention that includes at least one metallocene of formulas III or IV, at a proper temperature and pressure.

[0038] $\text{C}_2\text{-C}_8$ alpha-olefins, such as ethylene, propylene, 1-butene, 1-hexene, 1-octene, 4-methyl-1-pentene are used as monomer. In case ethylene is used as the monomer, it is polymerized either alone or in combination with a comonomer. Preferred comonomers are propylene, butene, hexene, octene or branched ones such as 4-methyl-1-pentene and are used in proportions from 0.1 to 70% by weight of the total of the monomers. In the case of homopolymerization of ethylene the density of the obtained polymers ranges between 0.950 and 0.965 kg/cm^3 ; in the case of copolymerization of ethylene, the density is as low as 0.900 kg/cm^3 .

[0039] In the particular case of the polymerization technique known as suspension process or controlled particle morphology process, the used temperature will be between 30° and 110 °C, the same which is typically used in gas phase, while for the solution process the usual temperature will be between 120° and 250°C.

[0040] The used pressure changes according to the polymerization technique; it ranges from atmospheric pressure to 350 MPa.

[0041] The following examples are described in order to better understand the invention. The materials, the chemical compounds and the conditions used in these examples are illustrative and do not limit the scope of the invention.

EXAMPLES

[0042] All air and/or moisture sensitive compounds were manipulated using standard vacuum line, Schlenk and

EP 1 095 944 A1

cannula techniques or in a glovebox under a nitrogen atmosphere. All solvents were distilled over sodium and benzophenone and stored under nitrogen. NMR spectra were recorded on a Bruker avance DRX 500 spectrometer at 500 MHz.

5 Example 1

Synthesis of 1-trimethylsiloxy-pentan-2-one.

10 [0043] 5-hydroxy-2-pentanone (39.7 g, 0.39 mol) was placed in a three-neck round bottom flask equipped with a bubbler. A few drops of trimethylsilylchloride were added to the flask and then hexamethyldisilazane (31.4 g, 0.20 mol) was dropped via addition funnel over half an hour period. Ammonia evolved vigorously from the reaction and temperature increased. After addition, the mixture was slowly heated until 125°C. Evolution of NH₃ ceased after 10 minutes, but heating was maintained at that temperature for one additional hour. The product was distilled at 10 mbar and 61-65°C, yielding a colorless oil (38.0 g, 56% yield). ¹H NMR (CDCl₃): δ 3.45 (CH₂, t, 2H), 2.37 (CH₂, t, 2H), 2.02 (CH₃, s, 3H), 1.66 (CH₂, m, 2H), -0.03 ((CH₃)₃, s, 9H).

Example 2

Synthesis of 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane.

20 [0044] Freshly distilled cyclopentadiene (61.5 g, 0.93 mol) was placed in a one liter Schlenk flask and dissolved in dry THF (500 ml). n-BuLi 2.5 M in hexane (372 ml 0.93 mol) was slowly added to this solution at -78°C, yielding a white precipitate. The suspension was left to reach room temperature and then heated to 65°C for one hour. The reaction mixture is thermostated at 20°C and a solution of 1-trimethylsiloxy-pentan-2-one (72.5 g, 0.42 mol) in THF (100 ml) was slowly added. The yellow suspension obtained was heated at reflux for 16 h. The resulting brown suspension was filtered and the solid washed with hexane several times. Solvents were removed under vacuum and the orange oil obtained was distilled at 10⁻³ mbar and 84-89°C, obtaining a yellow oil (20.5 g, 17% yield). ¹H NMR (CDCl₃): δ 6.40-6.02 (C₅H₅, 6H), 3.55 (CH₂, m, 2H), 2.97, 2.80 and 2.78 (C₅H₅, 4H), 1.82 (CH₂, m, 2H), 1.42 (CH₂, m, 2H), 1.40 (CH₃, s, 3H), 0.10 ((CH₃)₃, s, 9H).

30 Example 3

Synthesis of 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane zirconium dichloride.

35 [0045] The previously distilled ligand (20.2 g, 0.07 mol) was placed in a 500 ml Schlenk flask and dissolved in dry hexane (250 ml). n-BuLi 1.6 M in hexane (87.3 ml 0.14 mol) was dropwise added to this solution at 5°C. The resulting white suspension was heated to 75°C for a 6 h period until the total formation of the dilithium salt was confirmed by NMR. The mixture was left to cool down to room temperature, filtered and dried under vacuum. ZrCl₄ (16.28 g, 0.07 mol) was placed in the 500 ml Schlenk flask and toluene (200 ml) was added, and, at the same time, toluene (200 ml) was added to 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane dilithium salt. Both suspensions were cooled to -78°C and the dilithium salt slurry was, via cannula, added to the ZrCl₄ one. The resulting off-white suspension was allowed to warm to room temperature and stirred for 16 h. The resulting orange-red suspension was filtered and the cake washed with toluene (100 ml). The solvent was removed under vacuum and the resulting oily solid was repeatedly extracted with hexane, concentrated to 1/10 in volume and cooled to -30°C to afford yellow crystals of the product. 45 (6.8 g, 22% yield). ¹H NMR (CDCl₃): δ 6.70 (C₅H₄, d, 4H), 5.82 (C₅H₄, d, 4H), 3.75 (CH₂, t, 2H), 2.28 (CH₂, m, 2H), 1.83 (CH₂, m, 2H), 1.80 (CH₃, s, 3H), 0.18 ((CH₃)₃, s, 9H).

Example 4

50 Synthesis of 2,2-bis(cyclopentadienyl)-5-hydroxy-pentane zirconium dichloride.

[0046] XPO 2407 silica, provided by Grace, (7.2 g) was placed in a 250 ml dark-coloured Schlenk flask and washed with toluene (2x200ml). Toluene (150 ml) and a solution of 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane zirconium dichloride (2.0 g, 0.0045 mol) in toluene (50 ml) were added and the slurry was stirred for 90 h. After this time the mixture was filtered and the solvent removed under vacuum. Affording a yellow solid (0.16 g, 9.5% yield). ¹H NMR (CDCl₃): δ 6.70 (C₅H₄, d, 4H), 5.83 (C₅H₄, d, 4H), 3.85 (CH₂, t, 2H), 2.32 (CH₂, m, 2H), 1.88 (CH₂, m, 2H), 1.80 (CH₃, s, 3H), 1.45 (OH, s, 1H).

Example 5

Preparation of catalyst

5 Catalyst 1

[0047] 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane zirconium dichloride (40 mg, 0.089 mmoles) was placed in a 100 ml Schlenk flask and dissolved in toluene (50 ml). From this solution 4.3 ml (0.0077 mmol) were taken in a syringe and injected into the Büchi reactor.

10

Catalyst 2

[0048] TA02794/HL/PQ/3 silica-MAO provided by Witco (5.0 g) was placed in a round bottom flask under nitrogen and toluene (150 ml) was added. While mechanically stirring, a yellow solution of 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane zirconium dichloride (161 mg, 0.359 mmol) in toluene (30 ml) was added via cannula. The orange suspension was mechanically stirred for a 2 h. period at room temperature. The slurry was filtered, washed with toluene and dried under vacuum for 16 h. The resulting catalyst was analyzed by X-Ray fluorescence: 0.59% Zr and 22.7% Al.

15

Catalyst 3

20

[0049] TA02794/HL/04 silica-MAO provided by Witco (5.2 g) was placed in a round bottom flask under nitrogen and toluene (85 ml) was added. While mechanically stirring, a yellow solution of 2,2-bis(cyclopentadienyl)-5-trimethylsiloxy-pentane zirconium dichloride (165 mg, 0.368 mmol) in toluene (25 ml) was added via cannula. The red suspension was mechanically stirred for a 2 h period at room temperature. The slurry was filtered, washed with toluene and dried under vacuum for 16 h. The resulting catalyst was analyzed by X-Ray fluorescence: 0.58% Zr and 20.50% Al.

25

Catalyst 4

[0050] 2,2-bis(cyclopentadienyl)-5-hydroxy-pentane zirconium dichloride (5 mg, 0.013 mmol) was placed in a 25 ml Schlenk flask and dissolved in toluene (3 ml), 10 ml of MAO (0.81 M in toluene) were added and the solution was stirred for 1 h. This solution was taken in a syringe and injected into the Büchi reactor.

30

Catalyst 5

[0051] TA02794/HL/04 silica-MAO provided by Witco (3.0 g) was placed in a round bottom flask under nitrogen and toluene (85 ml) was added. While mechanically stirring, a yellow solution of 2,2-bis(cyclopentadienyl)-5-hydroxy-pentane zirconium dichloride (85 mg, 0.225 mmol) in toluene (25 ml) was added via cannula. The green suspension was mechanically stirred for a 2 h period at room temperature. The slurry was filtered, washed with toluene and dried under vacuum for 16 h. The resulting catalyst was analyzed by X-Ray fluorescence: 0.54% Zr and 22.10% Al.

40

Example 6

Polymerization

45 Experiment 1

[0052] Polymerization was carried out in a 1l Büchi reactor under dry conditions. The reactor was charged with 600 ml of dry heptane and heated to 90°C. Cocatalyst was added via syringe at room pressure, then it was increased to 4 bar and catalyst 1 was injected. The slurry of the forming polymer was stirred at 1200 rpm for 15 minutes. After this time, ethylene feed was closed and the reactor vented to room atmosphere. The slurry was collected and stirred with acidified methanol for several hours, filtered and vacuum-dried. Activity was measured as grams of polymer per mol of catalyst per atmosphere per hour.

50

Experiment 2

55

[0053] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 4 bar and catalyst 1 is injected.

EP 1 095 944 A1

Experiment 3

5 [0054] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 3,75 bar and the corresponding amount of catalyst 2 was added with 0,25 bar overpressure of ethylene.

Experiment 4

10 [0055] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 3,75 bar and the corresponding amount of catalyst 2 was added with 0,25 bar overpressure of ethylene.

Experiment 5

15 [0056] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 3,75 bars and the corresponding amount of catalyst 3 was added with 0,25 bars overpressure of ethylene.

Experiment 6

20 [0057] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 4 bar and catalyst 4 is injected.

Experiment 7

25 [0058] The polymerization was carried out in the same reactor and under the same conditions than experiment 1, but in this case hexene was added right after the cocatalyst at room pressure, then it was increased to 3,75 bars and the corresponding amount of catalyst 5 was added with 0,25 bars overpressure of ethylene.

Claims

1. Single-carbon bridged bis cyclopentadienyl compounds characterized by the following general formula I

wherein

each L, equal to or different from each other, is selected from the group consisting of:

wherein

each R^1 equal to or different from each other is selected from the group consisting of: hydrogen, a monovalent aliphatic or aromatic hydrocarbon group, optionally containing heteroatoms of group 14 to 16 of the periodic table of the elements and boron; optionally two R^1 form an aromatic or aliphatic ring; each R^2 , equal to or different from each other, is selected from the group consisting of: C_1 - C_{20} alkylidene, C_3 - C_{20} cycloalkylidene, C_2 - C_{20} alkenylidene, C_6 - C_{20} arylidene, C_7 - C_{20} alkylarylidene, C_7 - C_{20} arylalkylidene, C_8 - C_{20} arylalkenylidene, C_8 - C_{20} alkenylarylidene, linear or branched, optionally containing heteroatoms of group 14 to 16 of the periodic table of the elements or boron; one R^2 is optionally absent; in this case A is directly bonded to C and is preferably hydrogen; each A, equal to or different from each other, is selected from the group consisting of: hydrogen, OR^3 , NRR^4 , or SR^5

wherein

each R^3 is independently selected from the group consisting of: R, SiR_3 , SO_2R , CR_2OR , CR_2SR , or any other group used as protective group of alcohols in organic synthesis; each R^4 is independently selected from the group consisting of: R, SiR_3 , SO_2R , or any other group used as protective group of amines in organic synthesis; each R^5 is independently selected from the group consisting of: R, SiR_3 , CR_2OR , CR_2SR , or any other group used as protective group of thiols in organic synthesis; each R is independently selected from the group consisting of: C_1 - C_{20} alkyl, C_3 - C_{20} cycloalkyl, C_6 - C_{20} aryl,

EP 1 095 944 A1

C₂-C₂₀ alkenyl, C₇-C₂₀ arylalkyl, C₇-C₂₀ alkylaryl, C₈-C₂₀ arylalkenyl, C₈-C₂₀ alkenylaryl linear or branched; optionally two R form a aliphatic or aromatic ring; with the proviso that at least one A is not hydrogen.

2. Bis cyclopentadienyl compounds according to claim 1 wherein each R¹ is independently selected from the group consisting of: hydrogen; C₁-C₂₀ alkyl; C₃-C₂₀ cycloalkyl; C₆-C₂₀ aryl; C₂-C₂₀ alkenyl; C₇-C₂₀ arylalkyl; C₇-C₂₀ alkylaryl; C₈-C₂₀ arylalkenyl; C₈-C₂₀ alkenylaryl; linear or branched, optionally substituted by BR₂, OR, SiR₃, NR₂.
3. Bis cyclopentadienyl compound, according to claims 1-2 wherein each R is independently selected from the group consisting of: butyl, propyl, ethyl, methyl.
4. Bis cyclopentadienyl compound, according to claims 1-3 wherein each R² is independently selected from the group consisting of: butylidene, propylidene, ethylidene, methylene.
5. Bis cyclopentadienyl compound, according to claims 1-4 wherein at least one A is OSiR₃.
6. Process for obtaining a bis cyclopentadienyl compound, according to claims 1-5 comprising the step of contacting a metallating compound selected from the group consisting of: organolithium compounds, organosodium compounds, organopotassium compounds, organomagnesium, sodium hydride, potassium hydride, lithium, sodium, or potassium with a compound (LH) selected from the group consisting of

and with a compound of general formula II

increasing the temperature and recovering the product.

7. Process for the preparation of a bis cyclopentadienyl compound according to claims 1-5 wherein the two L groups are different, comprising contacting a metallating compound selected from the group consisting of: organolithium compounds, organosodium compounds, organopotassium compounds, organomagnesium, sodium hydride, potassium hydride, lithium, sodium, or potassium with a compound (LH) selected from the group consisting of:

with a compound of general formula II

adding a second compound LH different from the first one;
adding a second amount of metallating compound
increasing the temperature and recovering the product.

8. Process according to claim 7 wherein the second compound LH is premixed with the second amount of metallating compound before addition to the reaction mixture.

9. Metallocene complex characterized by the following formula

wherein :

each L' is independently a cyclopentadienyl compound which forms with the metal an η^5 complex, and is selected from the group consisting of:

M is a transition metal of groups 3-6 of the periodic table; m is a number coinciding with the oxidation state of the transition metal;
each X, equal to or different from each other, is selected from the group comprising: halogen, hydrogen, OR, N(R)₂, C₁-C₂₀ alkyl or C₆-C₂₀ aryl.

10. Metallocene complex according to claim 9 wherein M is selected from the group consisting of: zirconium, titanium or hafnium; X is halogen.

11. Process for obtaining a metallocene complex according to claims 9 and 10 comprising the following steps:

- Reacting a compound of general formula I with a metallating compound selected from the group consisting of: organolithium compounds, organosodium compounds, organopotassium compounds, organomagnesium, sodium hydride, potassium hydride, lithium, sodium, or potassium;
- Reacting the obtained product with a compound of general formula MX_mE_q, wherein E is an ether or an amine forming an adduct with M and q is 0, 1, 2, 3 or 4.

12. Metallocene complex characterized by the following general formula

wherein each B is selected from the group consisting of: OH, NRH or SH.

13. Catalysts for the polymerization of olefins comprising at least a metallocene complex according to claims 9, 10 or 12 and a cocatalyst.

14. Polymerization catalyst according to claim 13 further comprising an inorganic support.

15. Supported polymerization catalyst according to claim 14 wherein the inorganic support is selected from the group consisting of: silica, MAO modified silica, alumina, silica alumina, aluminum phosphates and mixtures thereof.

16. Supported polymerization catalyst according to claims 14-15, wherein at least one group A of the metallocene is OSiR₃ and the inorganic support is MAO modified silica.

EP 1 095 944 A1

17. Process for obtaining supported catalyst component according to claims 14-16 comprising the following steps:

- a) reacting, under anhydrous conditions and inert atmosphere, a solution of at least one metallocene complex of formula III or IV, with a suspension of the supporting material in an aliphatic or aromatic hydrocarbon at a temperature between -20° C and 90 °C;
b) filtration and washing with an aliphatic or aromatic hydrocarbon.

18. Process for the polymerization of olefins characterized by the use of the catalyst according to claims 13-16.
